

How to Mod SDSG

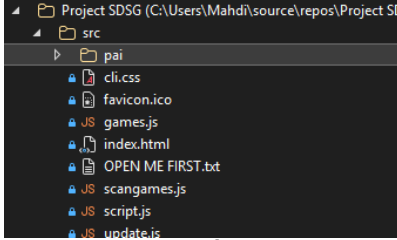

You need vscode or visual studio (or if your using school computer vscode.dev)

Then you open up your SDSG install

This is what it should look like (Visual Studio) this is the official Mahdiisdumb dev version that's why files exist while yours don't

Open Up src/ and that's where we start

After opening up src/ you should see this these files are for the CLI intro you can mod

Don't touch anything but script.js, cli.css, index.html

script.js is the terminal commands and what they do so open it up so we can mod it

```
const cli = require('cli');
const fs = require('fs');
const path = require('path');
const readline = require('readline');
const { exec } = require('child_process');

const cli = require('cli');
const fs = require('fs');
const path = require('path');
const readline = require('readline');
const { exec } = require('child_process');

const cli = require('cli');
const fs = require('fs');
const path = require('path');
const readline = require('readline');
const { exec } = require('child_process');

const cli = require('cli');
const fs = require('fs');
const path = require('path');
const readline = require('readline');
const { exec } = require('child_process');

const cli = require('cli');
const fs = require('fs');
const path = require('path');
const readline = require('readline');
const { exec } = require('child_process');

const cli = require('cli');
const fs = require('fs');
const path = require('path');
const readline = require('readline');
const { exec } = require('child_process');

const cli = require('cli');
const fs = require('fs');
const path = require('path');
const readline = require('readline');
const { exec } = require('child_process');

const cli = require('cli');
const fs = require('fs');
const path = require('path');
const readline = require('readline');
const { exec } = require('child_process');

const cli = require('cli');
const fs = require('fs');
const path = require('path');
const readline = require('readline');
const { exec } = require('child_process');

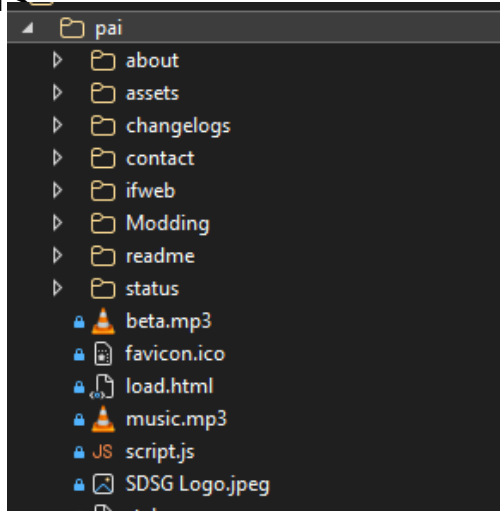

const cli = require('cli');
const fs = require('fs');
const path = require('path');
const readline = require('readline');
const { exec } = require('child process');
```

This file is the terminal you can mod the steps to launch command names command actions everything

its minified so it's not like this but this is the expanded version of it for reference of visibility

Next, we'll show you how to mod regular SDSG

Open up pai/ and you'll see a network of folders_

These are the folders you access on the main page

All you need to know is that
assets=everything

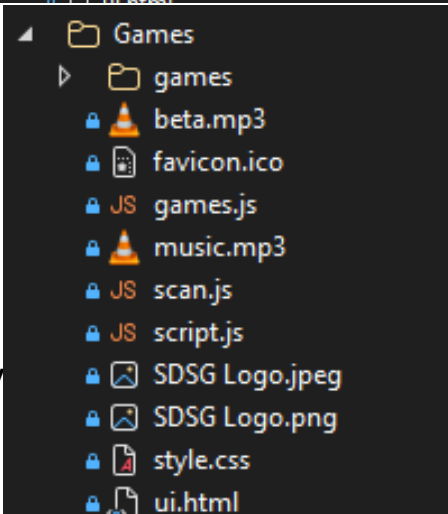

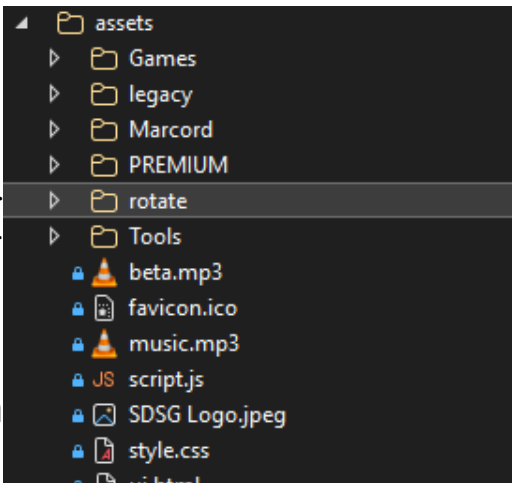

DO NOT MESS
WITH
PREMIUM OR
MAHDI
STUDIOS
WILL MAKE IT
FREE AND
RUIN IT FOR
EVERYONE
WHO PAID

To add your unverified games, open up assets/ you'll see this

Regular Games ->
Legacy Games ->
Marcord(Chat) ->
Premium(dont touch)->
rotate ->
Tools ->

to mod it open up games
or legacy if you want to
see how ass it was back in
the day if you open up
games you should see this
safely place the directory
of your game in games
directory in here and make
sure it has a run.html file
after that use node.js to
execute scan.js that's really
it

Remember if you update
Project SDSG your mods are rendered useless youd
need to mod it again unless if you hit the send games
button in the landing page of SDSG
